

CoreFTP

Connecting To A Server

- In order to connect to a FTP server, first set up a site in the Site Manager or the Quick Connect.
- To get to the Site Manager, click on the File button on the top left of the screen, then select “Connect”.

Adding A Site

- Once you have started up the site manager, the first thing you want to do is click on the "new site" button. This will set up a new site profile that we will use to connect to a FTP server.
-
- The most critical pieces of information that are needed to connect to a server are:
-
- 1: Host/Server, Internet Address (IP), or URL.
- 2: Username
- 3: Password
- The only additional information your ISP may provide is an alternative port. In most cases the port will always be 21.
- Example:
- (image 3)
-

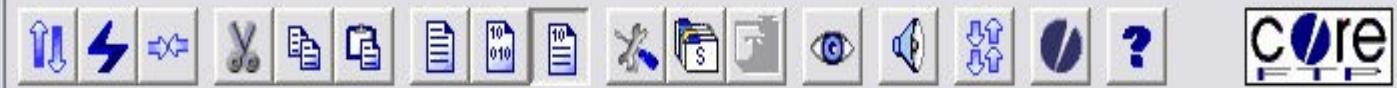

- Upon successful connection, you will see on the right side of the split screen(remote) list of files listed. These are files that are on the Internet.
- The files on the left side of the split screen are what is on your computer.
-
- If you can connect using your own information, you have now completed the first step in using FTP!
-

Transferring Files

- Now start transferring files between your computer and the remote FTP server.
- When creating a website, you have to upload your web pages to the FTP server so that the rest of the internet can view them via a web browser. One of the more common files you will deal with is an **index.html** file. This file is the first file that will be browsed when someone goes to visit your website.
-
- Your files on your computer are displayed in the local directory listing which is on the left side of the screen. This tutorial assumes you know how to locate your files on your hard drive. Many web page editors will put your files in your "My Documents" or other easy to find places.
-
- To upload a file to the FTP server, all you have to do is select (highlight) the **index.html** file in the local directory listing, and then click on the upload button. You can alternatively right click on the selected file, and select upload, or click and drag the file over to the remote directory listing.
